Improve your business with an improved plugin solution for e-commerce

03-03-2026

For e-commerce stores based on the WooCommerce platform, Croatian Post has a plugin that makes it easier to submit requests for picking up shipments and quickly print address labels.

The Croatian Post website has recently made available to business users an additional, improved HP Paket24 plugin software solution for e-commerce based on the WooCommerce platform. The new plugin will make it easier for you to submit requests for picking up shipments and quickly print address labels.

What is the HP Paket24 plugin ?

It is a software plugin that is used to automatically submit requests for collecting shipments ordered in e-commerce and to create address labels with the corresponding shipment number so that your packages with orders can be processed and delivered:
to the recipient's address using the Paket24 service
in the parcel machine of the Croatian Post or to the post office.

A flexible solution for different situations

You can select a delivery option with just one click. By selecting a parcel machine as a delivery option, a display of active parcel machines and post offices of the Croatian Post is available. The user can choose which parcel machine or post office he wants to pick up the shipment from. If he has allowed access to his location, an overview of parcel machines in the area is displayed on the map. The software extension also has the ability to adjust prices depending on the type of service selected, which each e-commerce administrator can independently configure along with other basic e-commerce data.
